

Smart card security for the mobile world

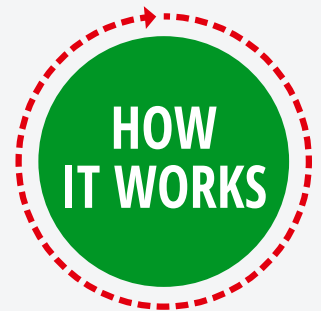

Smart card level security for transactions

Air+ is a Bluetooth and USB signature token that, in combination with the m-Identity technology, can be used for secure transaction signatures. All transaction details are displayed on the independent Air+ Display and are signed with the integrated chip card. Air+ can be used on mobile end devices via Bluetooth as well as on desktop PCs via USB.

What you see is what you sign

Use it to sign your transactions and receive the information to be confirmed on a 1,7" TFT color display. The replaceable card allows for a rollout of the device separated from the identity of the user and contains the digital identity of the user in the form of a certificate. The storage of the device contains the Trusted Web View which establishes a secure connection to website and forms. The access is authorized with the chip card and the respective PIN.

One device – two platforms

Air+ is being delivered in combination with the Smart Security Management Server, which monitors all security checks in the backend. The confirmations of the transaction signatures are verified by the SSMS and are then forwarded to your enterprise application. The completed process then receives a digital signature by the user in order to ensure a non-reputability for the company. The entire communication between your apps, the Air+ and the SSMS is end-to-end encrypted and is offering the highest level of security on mobile devices as well as desktop PCs.

Air+

Bluetooth Chip card reader, USB cable, ATOS Card OS 4.4 chip card

Smart Security Management Server

Software package providing the security infrastructure

Manuals

Installation manual, individualization guide, SOAP interface specifications

Support

E-Mail support, telephone support (for service contract partners)

Investment Protection

By using this package you are prepared to implement easily additional modules of Kobil's Secure Identity Processing Suite for future mobile business services.
