

The one time password system

The weakest link in the chain of the network is the user

The acceptance of authentication solutions by the employees starts with its simplicity. The more user friendly the solution, the more likely the employees will be willing to use it.

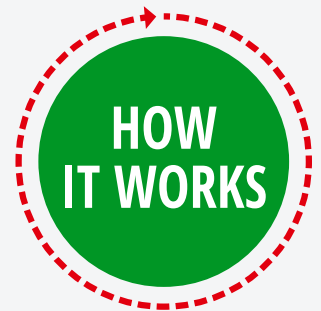

This doesn't necessarily have to be in conflict with the security concerns of the IT department as with our SecOVID solution we cover just that. User-friendliness and security at an unbeatable price and that for the desktop based as well as the mobile world.

Whether mobile or hardware based, the use remains simple

The use of SecOVID does not require a complicated integration. SecOVID uses well known interfaces like Radius or SOAP and can therefore be integrated into your IT landscape with little effort. This enables the continuous use of your existing infrastructure as well as the seamless transition to going live.

Our Smart Security Management Server (SSMS) only allows employees who either use a SecOVID hardware token or the mobile SecOVID mobile to gain access to your company network.

As SSMS is web based and is offering a striking GUI its use presents no challenge to the Administrator.

Proven technology future secure

OTP based authentication solutions have been proven in the industry for years. Many of these solutions however have a problem. They are neither prepared for future challenges of the mobile world nor for new security strategies. In the worst case this means that you have to use two solutions for the protection of your company network.

This is where we offer a workaround with our SecOVID solution and the security server (SSMS) as they are modular in design. This means that our solution adapts itself to your security requirements. Should you wish to extend your strategy with mobile devices or PKI this can seamlessly be implemented. Thus our SecOVID solution not only just offers investment security but a rapid ROI.

Token Types
(Software & Hardware)
